

Guidelines for Animals in Madison County School District

The purpose of these guidelines is to provide information which will promote safety for school staff and students when animals are brought into the classroom. Many times, inadequate understanding of animal disease and behavior can lead to unnecessary risks for the children and animals alike.

These guidelines are designed to promote a better understanding of:

1. Which animals are not safe to bring into classroom situations,
2. Safety precautions for animals which have the potential to transmit disease to children,
3. Safety precautions for introducing animals into classroom situations, and
4. How to properly handle animal wastes to limit the spread of disease from animals to children.
5. Steps to take if a child is bitten or scratched by an animal.

I. Animals Which Are UNACCEPTABLE for Schools

A. Venomous Animals – Venomous animals including spiders, insects, and poisonous snakes, reptiles, amphibians and lizards should be prohibited from being brought onto school grounds. Exceptions to this recommendation include those instances when such animals are presented at schools by professionals who have experience handling such animals, or the animals are displayed in cases which provide a physical barrier between the animal and the children (e.g., animal is enclosed behind sturdy glass or plastic).

B. Hybrid Offspring of Wild Animals- These animals may exhibit unpredictable behaviors, especially in unfamiliar situations that would occur in a classroom situation with children. Therefore, hybrid offspring of wild animals should not be allowed on school grounds.

C. Wild Animals – Some wild animals including non-human primates pose a risk for transmitting rabies as well as other zoonotic diseases (diseases which can be transferred from animals to man) and, therefore, should not be brought to schools or handled by children. Wild animals' behavior also tends to be unpredictable. Exceptions to this recommendation include those instances when wild animals are presented at schools by professionals who have experience handling wildlife, or the animals are displayed in enclosed cages which prevent contact between the animal and the children. Because of the high incidence of rabies in bats, raccoons, skunks, and wild carnivores, these animals should not be permitted on school grounds under any circumstances (including recently dead animals).

D. Stray animals - Stray animals should never be brought onto school campuses because the health and vaccination status of these animals is seldom known.

E. Baby Chicks and Ducks - Because of the high risk of salmonellosis and campylobacteriosis associated with baby chicks and ducks, they are inappropriate in schools.

F. Aggressive Animals - Animals which are bred or trained to demonstrate aggression toward humans and/or animals, or animals which have demonstrated aggression toward humans and/or animals in the past should not be permitted on school campuses. Aggressive, unprovoked, or threatening behavior will mandate the animal's immediate removal. Exceptions may be sentry or canine corps dogs for demonstration (or legal actions) that are under the control of trained military or law enforcement officials.

Guidelines for Animals in Madison County School District

II. General Guidelines for Animals in Schools

It is important that animals which are brought onto school campuses be clean and healthy to minimize the risk of disease transmission to students. Because children may contract certain zoonotic diseases due to lack of adequate hand washing and the tendency to put their hands in their mouth, it is important that animals which they handle be well groomed and free of internal parasites, disease, etc. Animals which are brought to school should be clean and free of external parasites such as fleas, ticks, and mites, to decrease the likelihood of the animal transmitting these vectors to the students. Visiting animals should be restricted to an area designated by the principal or administrator. Kittens and puppies may only be appropriate for short classroom visits.

Some children and adults may be allergic to dander and/or hair from animals. Occasionally, asthma may result from exposure to dander or hair. It is important to determine if any children or adults are allergic to animals prior to allowing the animal to enter the classroom. Because the allergens can persist after the animal has left the room and an allergic reaction can be triggered without the animal's presence, the room should be cleaned of allergens as soon as possible after the animal leaves the area.

A. Verified Rabies Vaccination – Kentucky requires that all dogs and cats over four months of age be currently vaccinated against rabies. Evidence of current rabies vaccination should be required for all dogs, cats, and ferrets which are brought onto school property for instructional purposes. Dogs and cats under three months of age and not vaccinated against rabies should not be handled by children.

B. Health Certificates for Dogs - A health certificate signed by a licensed veterinarian is required, showing proof of current vaccination against canine distemper, hepatitis, leptospirosis, parainfluenza, parvovirus, bordetella, and rabies. Animals must have had a negative fecal exam for internal parasites within the past six months. The animal should be free of external parasites such as fleas, ticks, and mites. Dogs over four months of age should be housebroken. Younger animals should be approved by the principal or administrator before visiting.

C. Health Certificates for Cats - A health certificate signed by a licensed veterinarian is required, showing proof of current vaccination against feline panleukopenia, rhinotracheitis, calicivirus, chlamydia, feline leukemia, and rabies. Cats should be free of external parasites such as fleas, ticks, and mites.

D. Livestock at School - Students should be supervised by responsible adults at all times. Students should not enter enclosed spaces that hold livestock unless they are properly supervised by a responsible adult. Young children should never enter enclosed spaces containing livestock. Direct animal contact should be reduced to the extent possible. Hand washing with liquid soap and water should occur after contact with animals and before eating, drinking or smoking. If possible, coveralls or similar clothing should be worn over "school clothes" in order to reduce the risk of transmission of disease from the animal to the school community. Clothing that is contaminated with feces or animal products should be cleaned with soap and water. It is preferable to change clothing after handling animals and before returning to the school environment. Raw dairy products should not be consumed. Other animal food products should be properly prepared to reduce the risk of disease transmission.

Guidelines for Animals in Madison County School District

III. Proper Restraint of Animals

Because animals may react strangely to classroom situations, it is important to have an effective way to control them. Fear may cause an animal to attempt to escape or even act aggressively in situations which are unusual to them. Appropriate restraint devices will allow the holder to react quickly and prevent harm to the students or escape of the animal.

A. Collars and Leashes - Dogs, cats and ferrets should be wearing a proper collar, harness, and/or leash when on school grounds or in the classroom so that they can be easily controlled. Household rope or string is not considered an appropriate restraint tool. Dogs and ferrets should have a collar or harness and a leash. Cats should have a collar. The owner or person responsible for the animal should stay with the animal during its visit to the school. No animal should be allowed to roam unrestrained on the school campus or in the classroom.

B. Pet Birds - Pet birds should never be allowed to fly free in a classroom.

C. Designated Areas - All animals should be restricted to the area designated by the principal or administrator. In school facilities in which the common dining area is also used as an auditorium, gymnasium, or multi-purpose room, animals may be allowed in the area at times other than during meals if:

1. Effective partitioning or self-closing doors separate the area from food storage or food preparation areas;
2. Condiments, equipment, and utensils are stored in enclosed cabinets or removed from the area when animals are present; and
3. Dining areas, including tables, countertops, and similar surfaces, are effectively cleaned before the next meal service.

D. Estrus - Dogs and cats should be determined not to be in estrus ("heat") at the time of the visit.

IV. Special Conditions for Specific Animals

Specific recommendations should be observed for the following animals because of zoonotic diseases that they can carry or because of certain tendencies:

A. Psittacine birds - Because psittacine birds can carry zoonotic disease such as psittacosis, such birds (parrots, parakeets, budgies, and cockatiels) should not be handled by children. Additionally, such birds may bite unfamiliar people. Birds showing any signs of illness should not be brought to the school. Psittacine birds may be brought to school as long as their cages are clean and the birds' wastes can be contained, such as within a cage. Psittacine birds permanently housed on school property in cages should be examined by a veterinarian and treated prophylactically for psittacosis 45 days prior to entering the premises. Visual inspection alone cannot rule out the presence of psittacosis, appropriate laboratory testing is necessary to determine if a bird is infected with the bacteria.

B. Ferrets - Ferrets can be allowed to visit school classrooms, but they must be handled by the person responsible for them. Because of their propensity to bite when startled, it is not recommended that school children hold ferrets visiting the classroom.

Guidelines for Animals in Madison County School District

C. Reptiles and Amphibians - Because all reptiles and amphibians can carry salmonella bacteria, even when reared as pets or for display, special precautions should be instituted when school children handle them. School children under 5 years of age should be prohibited from handling reptiles and amphibians. No turtles with a carapace length less than four inches are allowed in schools. Any child handling a reptile or amphibian should be instructed to wash his/her hands thoroughly with warm water and soap afterwards. "Wet wipes" should be used only as an adjunct to soap and water.

D. Pocket Pets - Because pocket pets (hamsters, guinea pigs, gerbils, etc.) can carry salmonella bacteria, even when reared as pets or for display, special precautions should be instituted when school children handle them. Lymphocytic choriomeningitis virus (LCMV) is known to exist in feral rodents and may be transmitted to pocket pets held in captivity. Therefore, school children under 5 years of age should be prohibited from handling pocket pets. Any child handling a pocket pet should be instructed to wash his/her hands thoroughly afterwards with soap and water. "Wet wipes" should be used only as an adjunct.

E. Fish - Disposable gloves should be worn when cleaning aquariums. Used tank water should be disposed of in sinks that are not used for food preparation or for obtaining water for human consumption.

F. Guide, Hearing, and other Service Dogs and Law Enforcement Animals – These animals should not be prohibited from being on school grounds or in classroom situations.

V. Student Contact with Animals

Even very tame animals may react aggressively in strange situations; therefore, student contact with animals should always be supervised and regulated by a few basic rules.

A. Because increased activity and sudden movements can make animals feel threatened, all student contact with animals should be highly organized and supervised.

1. Animal bites can usually be avoided if students are kept in small groups.
2. Rough play or teasing should not be allowed.

B. It is recommended that children not be allowed to feed pets directly from their hands.

C. Small animals such as rabbits, hamsters, gerbils, and mice should be handled with leather gloves whenever possible. Surprisingly, rabbits do not like to be held and will struggle to free themselves.

D. Children should be discouraged from "kissing" animals or having them in close contact with their faces. This statement is especially true for reptiles and amphibians.

E. Education with animals should be used to reemphasize proper hygiene and hand washing recommendations. All children who handle animals should be instructed to wash their hands immediately after handling them.

Guidelines for Animals in Madison County School District

F. Animals should not be allowed in the vicinity of sinks where children wash their hands, or in any area where food is prepared, stored, or served, or in areas used for the cleaning or storage of food utensils or dishes. Animals should also be restricted from nursing stations or sterile and clean supply rooms. Do not allow cats or dogs in sand boxes where children play.

G. Immunocompromised students may be especially susceptible to zoonotic diseases; therefore, special precautions may be needed to minimize the risk of disease transmission to these students. Consultation with the child's parents about precautionary measures is strongly advised.

H. Field Trips are an important teaching tool but can pose unique health risks because of the possibility of physical trauma and/or infectious diseases. Several precautions can make field trips a safe and effective learning tool:

Educate your chaperones:

- Healthy animals may carry bacteria and other infectious agents that sometimes make people sick.
- Young children under five years of age, elderly people, pregnant women and people of any age with compromised immune systems are more likely to get sick from these bacteria. They should avoid any contact with reptiles and amphibians.
- Washing hands well with soap and running water, or using an alcohol-based hand sanitizer after petting or touching animals can prevent illness.

Promote hand washing:

- Use hand washing facilities and/or hand sanitizers or bring your own hand sanitizers. Young children will need supervision.
- Remind or assist students to wash hands well after interacting with animals.

Promote food safety:

- Eat and drink in an area that is well apart from where people and animals interact, and always wash your hands before eating.
- If feeding animals, use only animal food. Do not allow students to feed "people food" to animals.
- Do not consume or allow students to consume raw (unpasteurized) dairy products.

VI. Handling and Disposal of Animal Wastes While on School Campuses

A. Clean Up of Animal Wastes - Children should not be allowed to handle or clean up any form of animal waste (feces, urine, blood, etc.). Animal wastes should be disposed of where children cannot come in contact with them, such as in a plastic bag or container with a lid or via the sewage system for feces. Food handlers should not be involved in the cleanup of animal waste.

B. Prohibited Areas - Animal wastes should not be disposed of, and visiting animals should not be allowed to defecate in or near areas where children routinely play or congregate (i.e., sandboxes, school playgrounds, etc.). Animals should not urinate or defecate in these areas.

C. Litter Boxes - Litter boxes for visiting animals should not be allowed in classrooms. Information should be provided to pregnant students or teachers about the risk of toxoplasmosis to an unborn child.

Guidelines for Animals in Madison County School District

VII. Humane Treatment

To avoid the intentional or unintentional abuse, mistreatment, or neglect of animals, the humane care and husbandry recommendations of the National Science Teachers Association and the National Association of Biology Teachers should be adopted (attached).

VIII. Wound Management

If a child or adult is bitten or scratched by an animal, wound treatment is important regardless of the apparent severity. Universal precautions should be used by the person attending to the wound. Bleeding should be stopped as quickly as possible. Where appropriate, the wound should be washed with soap and water, dried and dressing applied. Because of the possibility of infection, medical personnel should be consulted to determine if further treatment is necessary.

IX. Conclusion

Animals can serve as excellent teaching tools and students love to have them visit the classroom. When using animals as an instructional aid, the objective should always be well planned in advance. By following the above recommendations, the use of animals in the classroom can be made safer for both the animals and the children.

These guidelines were based on guidelines created by the Occupational and Environmental Epidemiology Branch and the General Communicable Disease Control Branch of the NC Division of Public Health.
